The production of Plutonium

E. Krupczak

17 Apr 2015

This is a document in which we discuss the procedure necessary for the refinement of Plutonium to create nuclear weapons.

$$m_{\mathrm{Pl}} = \frac{a^2}{b}$$

The atomic weight of plutonium is 244 u. The usual isotope is Pu 239.

$$M = \frac{e^{\frac{a^2}{b a_y} + \sqrt{\ln(a + \cos(b))}}}{7}$$
